

The box ladder is designed to provide safe and efficient access to vertical facades where the standard ladder system is not suitable.

Due to the "box" construction, the box-ladder becomes like a protecting cover, for the worker as well as for the area beneath. Inside the box ladder, there are several openable floors. This allows for 1-3 workers to work in different heights at the same time.

Because the box-ladder is built using only light-weight aluminium profiles, the weight is extremely low, allowing for long span between the fixing brackets for the track system.

The box ladder might also be used as carrier for commercial signs etc. Combining these two features in one installation, the contractor will achieve serious savings.
